Introduction

Trust Security has conducted an audit at the customer's request. The audit is focused on uncovering security issues and additional bugs contained in the code defined in scope. Some additional recommendations have also been given when appropriate.

Scope

All non-test changed files.

About Trust Security

Trust Security has been established by top-end blockchain security researcher Trust, in order to provide high quality auditing services. Since its inception it has safeguarded over 30 clients through private services and over 30 additional projects through bug bounty submissions.

About the Auditors

Trust has established a dominating presence in the smart contract security ecosystem since 2022. He is a resident on the Immunefi, Sherlock and C4 leaderboards and is now focused in auditing and managing audit teams under Trust Security. When taking time off auditing & bug hunting, he enjoys sharing knowledge and experience with aspiring auditors through X or the Trust Security blog.

Disclaimer

Smart contracts are an experimental technology with many known and unknown risks. Trust Security assumes no responsibility for any misbehavior, bugs or exploits affecting the audited code or any part of the deployment phase.

Furthermore, it is known to all parties that changes to the audited code, including fixes of issues highlighted in this report, may introduce new issues and require further auditing.

Methodology

In general, the primary methodology used is manual auditing. The entire in-scope code has been deeply looked at and considered from different adversarial perspectives. Any additional dependencies on external code have also been reviewed.

Findings

No findings have been identified.

Additional recommendations

TRST-R-1 Sensitive balance-based tracking remains after the code change

The code change addresses a quirk where the registered curation reward at the SubgraphService can include donated assets from an indexer's chosen payment destination. Our inspection determines the behavior does not break any meaningful invariants since the indexer may donate assets through a different API towards the Curator. Therefore, no production changes are mandated.

The elected change is successful with regards to stopping the balance-based counting combined with the **paymentsDestination** vector. However the change does not touch the fundamental footgun of balance-based accounting, so callbacks or collector upgrades could invalidate the assumptions which the change is based on and leave the quirk dormant. For the long-term, best practice is to change the collector API to include a split structure, avoiding the balance based calculation.
